Soil Detective with BioCharged

Compare growing pots and record what happens, whatever the result.

Little growers, big discoveries

20 MIN + CHECKS | SOIL AND FAIR COMPARISONS | AGES 5+ WITH AN ADULT

Grab your kit

Six matching small pots with drainage and saucers, the same growing material, 18 seeds of one type from one packet, BioCharged and its label, water, labels and a ruler.

Your discovery mission

1. Label three pots A1 to A3 and three B1 to B3. Add equal amounts of growing material and sow three seeds in each at the packet's recommended depth.
2. An adult follows the BioCharged label for the pot volume and treats group B. Give group A the same total liquid volume using water alone. Follow any repeat-application directions in the same way.
3. Keep all pots together in suitable light. Rotate their positions regularly and use the same watering rule for both groups. Keep each pot's drainage separate.
4. For four weeks, record how many seeds sprout, each seedling's height and leaf appearance weekly. Compare all three pots in each group; include similar or unexpected results.

What did you discover?

Week: ____ Sprouted seedlings in A: ____ In B: ____
A difference or similarity: _____

Draw your discovery

Let's wonder...

Why use three pots per group? Could differences between seeds affect the result?

NEXT ADVENTURE

Repeat with a fresh set of pots. A small home experiment can reveal observations but does not prove a product works in every situation.

An adult handles and doses BioCharged according to its label. Use separate tools for the groups and wash hands afterwards.
